The atbegshi package

Heiko Oberdiek* <heiko.oberdiek at googlemail.com>

2016/06/09 v1.18

Abstract

This package is a modern reimplementation of package everyshi without the burden of compatibility. It makes use of ε -TEX's if available. Both LATEX and plain TEX are supported.

1 Documentation

Package atbegshi redefines \shipout to insert hooks for user code that is executed before the page is shipped out. The code may modify or even discard the output page. Three hooks are implemented:

- 1. A hook that is executed for every page, see \AtBeginShipout
- 2. A hook that is executed for the next page only, see \AtBeginShipoutNext
- 3. A hook that is only executed for the first page, see \AtBeginShipoutFirst

The hooks are executed in this order. The following three macros provide the user interface for adding code to these hooks:

 $AtBeginShipout \{\langle code \rangle\}$ AtBeginShipoutBox

Execute the $\langle code \rangle$ for every page. The page contents is held in box register \AtBeginShipoutBox and may be modified. Use \AtBeginShipoutDiscard if you want to discard the page.

Note: Package everyshi uses box register 255. With package atbegshi you must use \AtBeginShipoutBox instead.

If LATEX calls \shipout in \@outputpage (part of its output routine), the meaning of \protect is \noexpand. LATEX sets \protect to the appropriate \@typeset@protect in the box that is shipped out. This is too late for the hooks, they are called earlier in the redefined \shipout. Therefore package atbegshi sets \protect to \@typeset@protect before it calls the hooks. (In \EveryShipout of package everyshi the user is responsible for the correct setting of \protect.)

$\AtBeginShipoutNext \{\langle code \rangle\}$

This reimplements package everyshi's AtNextShipout. The $\langle code \rangle$ is executed at shipout time of the next page only. It is just a convenience macro, it can be easily replaced by something like:

```
\newcommand{\MyShipoutHook}{}%
\AtBeginShipout{\MyShipoutHook}
\gdef\MyShipoutHook{%
... do something with next page ...
\gdef\MyShipoutHook{}%
}
```

(This can be necessary, if hook order does matter).

$\AtBeginShipoutFirst \{\langle code \rangle\}$

This reimplements IATEX's \AtBeginDvi. This hook is usually used for \special commands that include PostScript header files. The \code is directly executed in a \vbox that is put at the beginning of the output page. Dealing with the output box \AtBeginShipoutBox is not necessary and not permitted here.

\AtBeginShipoutDiscard

This macro notifies package atbegshi that the output page is discarded. The remaining hook code and the remaining hooks are not executed and the page is thrown away. Also \deadcycles is cleared to zero like an ordinary \shipout would do.

\AtBeginShipoutInit

Usually the redefinition of \shipout is delayed by \AtBeginDocument (if this macro exists). This can be too late, if other packages also redefines \shipout and the order does matter. \AtBeginShipoutInit forces the immediate redefinition of \shipout.

A quite common use case is the addition of \special or other whatsits to the page output box. Macro \AtBeginShipoutAddToBox puts $\langle stuff \rangle$ in a box with zeroed dimensions. The box with the $\langle stuff \rangle$ is put in the upper left corner of the shipout box \AtBeginShipoutBox. Macro \AtBeginShipoutAddToBox puts the $\langle stuff \rangle$ in the background, the other macro \AtBeginShipoutAddToBoxForeground in the foreground after the original shipout box contents is set.

A void shipout box (that means a discarded page) remains void that means $\langle stuff \rangle$ is ignored in this case. The box type of \AtBeginShipoutBox is preserved. Also the box nesting level for the original contents of \AtBeginShipoutBox remains, for example, to avoid trouble with links across pages in case of pdfTeX.

$AtBeginShipoutUpperLeft \{\langle background \ material \rangle\}$

This is a macro that puts material in the background of box \AtBeginShipoutBox. The \langle background material \rangle is set in an \hbox, the reference point is the upper left corner of the output page. In case of pdfTEX in PDF mode, the settings of \pdfhorigin and \pdfvorigin are respected.

The macro \AtBeginShipoutUpperLeft is intended to be used in one of the hook setting macros, such as \AtBeginShipout, \AtBeginShipoutFirst, or \AtBeginShipoutNext.

For LATEX users the \(\begin{aligned} background material \rangle \) is set inside a picture environment:

$AtBeginShipoutUpperLeftForeground {\langle foreground material \rangle}$

See \AtBeginShipoutUpperLeft. The difference is that the material is put in the foreground.

```
\AtBeginShipoutOriginalShipout\ \langle box \rangle
```

It stores the meaning of \shipout at the time this package is loaded.

These macros store the dimensions of the output box \AtBeginShipoutBox before the original shipout is called. If \shipout is not redefined before the package loading or the box dimensions are not changed by the redefined \shipout, these macros contain the dimensions of the shipout box. These values can be remembered by \label and \ref. For example, this is done by the package module zref-pagelayout of project zref. The dimensions of the shipout page can be used in some TeX engines (pdfTeX in PDF mode, XeTeX) to calculate the media size of the shipout page if \pdfpagewidth and \pdfpageheight are not set.

1.1 Examples

1.1.1 Example: circle in background

In this example we put a circle in the background in the middle of the paper.

- $_1$ $\langle *example1 \rangle$
- 3 \usepackage{color}
- 4 \usepackage{atbegshi}

Package picture makes life a little easier, because we can now also use length specifications in picture's commands.

```
5 \usepackage{picture}
```

Now we draw the circle in the middle of the paper. \put moves downwards, because the origin is at the top of the page, not at its bottom.

- $6 \AtBeginShipout\{\%$
- 7 \AtBeginShipoutUpperLeft{%
- 8 \put(0.5\paperwidth,-0.5\paperheight){\circle{10}}%

```
9 }%
10 }
11 \begin{document}
12 \section{Hello World}
13 \newpage
14 AtBeginShipoutNext{\%}
15 \AtBeginShipoutUpperLeft{%
16
     \color{red}%
     \put(0,-0.5\paperheight){\line(1,0){\paperwidth}}\%
17
     \put(0.5\paperwidth, 0){\line(0,-1){\paperheight}}\%
18
19 }%
20 }
21 Only on this page we add a red cross.
22 \newpage
23 This page has the circle only.
24 \par
25 \vspace{fill}
26\ {\rm The\ next\ page\ will\ be\ discarded}.
27 \setminus newpage
28 \AtBeginShipoutNext{%
29 \AtBeginShipoutDiscard
30 }
31 This page is discarded.
32 \newpage
33 The last page.
34 \end{document}
35 (/example1)
```

1.1.2 Example: adding TrimBox for dvipdfmx

Now an example from "real life" follows. Someone from the mailing list for dvipdfmx wants to put a TrimBox on every page. If we use \AtBeginShipout, we have to put the \special inside the box \AtBeginShipoutBox that gets shipped out.

```
36 (*example2)
37 \documentclass{minimal}
38 \usepackage{atbegshi}
39 \usepackage[
40 dvipdfm,
41 paperwidth=630bp,
42 paperheight=810bp
43 ]{geometry}
44 \AtBeginShipout{%
45 \setbox\AtBeginShipoutBox=\hbox{%
46
     \special{pdf: put @thispage <</TrimBox[9 9 621 801]>>}%
47
     \box\AtBeginShipoutBox
48 }%
49 }
50 \begin{document}
51 First page
52 \newpage
53 Second page
54 \end{document}
55 (/example2)
```

Remember, in \AtBeginShipoutBoxFirst the \setbox wrapper code is implicitly given and the \special is used directly.

2 Method of \shipout overloading

2.1 \shipout

The TeX primitive command \shipout takes a box specification and puts the box as a new page in the output file. There are two kinds of box specifications:

Direct boxes: They are given by \hbox, \vbox, or \vtop, e.g. \shipout\hbox{Hello World}.

Indirect boxes: \box or \copy references a box register by number. The box register contains the contents of the box.

Note: \box also clears the box register globally.

Then we have to differentiate between void and empty boxes:

Void: Initially or after \box there is no box in the box register. In this cases the box register is not empty, but *void*.

Empty: A box with empty contents, such as \hbox{} (= \null) or \vbox{} is an *empty* \hbox or *empty* \vbox. If a box register holds such a box, the box still exists, therefore the box register is *not void*.

2.2 \afterassignment

We want to overload \shipout to do something with the box. It is quite impossible to do this reliable by catching the box using macro arguments. The variety of box specifications is too large, Examples:

```
\shipout\null
\shipout\vbox{...}
\shipout\vtop\bgroup ...\egroup
\shipout\box255
```

Even worse, the braces don't need to be balanced:

```
\shipout\hbox\bgroup}
\shipout\vbox{\egroup
```

Happily TeX provides a reliable way via \afterassignment. It takes a macro name and executes it just after the assignment.

Now we can redefine \shipout. The box specification that follows \shipout is catched by \setbox. This is an assignment to a box register. \afterassignment notifies T_FX, that we want to call \@test right after the assignment:

```
\shipout :=
\afterassignment\@test
\setbox\mybox=
```

We have seen different box specifications. Indirect boxes are easy to understand:

However direct boxes can have arbitrary contents with lots of other assignments. It would be quite inpredictable if TeX would put **\@test** after the first of such an assignment or after the box specification if the box lacks of assignments. Therefore TeX puts **\@test** right at the beginning of the box specification, e.g:

```
\shipout\hbox{Hello World}

⇒ \setbox\mybox=\hbox{\\detat Hello World}
```

2.3 Test for direct or indirect boxes

Now we want to execute **\@test**, but where are we? We can be after the completed box assignment, if **\shipout** was called with an indirect box. Or we are right at the beginning of a direct box.

2.3.1 With ε -T_EX

With the ε -TEX's extensions the answer is very easy: Being inside the direct box means that we are inside a new group. The new primitive command \current-grouplevel tells how deeply the groups are currently nested. Macro \@test just compares the previously stored group level with the current one:

```
\shipout :=
  \edef\saved@grouplevel{\number\currentgrouplevel}
  \afterassignment\@test
  \setbox\mybox=

\@test :=
  \ifnum\saved@grouplevel=\currentgrouplevel
    % case: indirect box, the assignment is completed
    \@output
  \else
    % case: direct box, we are inside the box
  \aftergroup\@outbox
  \f
```

2.3.2 Without ε -TeX

Life becomes complicate without ε -TeX. We cannot ask the group level. However, if we are inside a direct box, the box register \mybox is not yet changed by \setbox. Thus we need a special initial value and compare it in \@test with the current value of the box.

What can be used as initial value? Arbitrary box contents cannot be compared. TEX only tells us a few properties:

• Box type:\ifhbox, \ifvbox

• Dimensions: \wd, \ht, \dp

• Voidness: \ifvoid

Unhappily all these qualities even combined are not sufficient for constructing an initial box value, because \shipout can be called with a box that is accidently just the same as the choosen initial value.

Nevertheless we have two alternatives for an initial value:

- A box of some type with some funny settings that are unlikely to occur in real life, e.g a height of 4911sp-\maxdimen.
- · A void box.

A collision between this initial value and an indirect \shipout box with just the same value is possible. Then \@test will make a wrong decision that it is executed inside a direct box and delays \@output by \aftergroup. Thus \@output is not called at the place we want. In contrary, the result is an uncertainty about the place:

- \shipout is used in a group that perhaps closes some pages later. A bad place for \@output.
- Without a surrounding group \aftergroup effectively kills its argument.

In the first case of a box with special dimensions we can even loose the page. However in the case of the void box, this effect is even desired, because the original \shipout does not output void boxes. All we have to do is to ensure that our box \mybox is always void except for the phase when the overloaded \shipout is executed. And secondly we must keep this semantics of \shipout for the void case in our macros, namely \@output.

```
\shipout :=
  % trick to get a void box \mybox
\begingroup
  \setbox\mybox=\box\mybox
\endgroup
\afterassignment\@test
\setbox\mybox=

\@test :=
  \ifvoid\mybox
  \aftergroup\@output
\else
  \@output
\fi
```

The nasty case is \shipout\box\voidb@x where the indirect box is void and that must not generate an output page. If a surrounding group is missing the output is ignored because of \aftergroup. Otherwise output is called some time later when the surrounding group closes. But \mybox is void outside the execution phase of the redefined \shipout. Also \@output checks for a void box and cancels the page output. The disadvantage remains that the hook in \@output is called for a page that will not be output.

2.3.3 \lastkern method

At the beginning of a new box, there is no \kern, the contents of the box is still empty and \lastkern returns 0 pt. This can be used to distinguish between direct and indirect boxes: We execute \setbox in a box with a preceding non-zero kern. After an indirect box, \lastkern sees this kern, otherwise it returns 0 pt.

```
\shipout :=
 \begingroup
  \setbox\mybox=\hbox\bgroup
    \kern1pt
    \afterassignment\shipout@test
    \global\setbox\mybox=
\@test :=
 \ifdim\lastkern=0pt
  % direct box
  \aftergroup\egroup
  \aftergroup\endgroup
  \aftergroup\@output
 \else
  \egroup
  \endgroup
  \@output
 \fi
```

We have two \setbox commands. The first creates a controlled context box where we can safely insert a \kern. We get rid of this temporarily used context box by putting the local \setbox in a group.

After the group we want to have our shipout box in \mybox. Therefore we use a global assignment here.

2.4 Output

With or without ε -TeX we ensure the original behaviour of \shipout that void boxes do not generate output pages.

Now we can place the hook **\@hook** for the user code that wants to manipulate the output box.

```
\@output :=
\ifvoid\mybox
% cancel output of void box
\else
\@hook
\ifvoid\mybox
% user code in \@hook could has voided the box
\else
\original@shipout\box\mybox
\fi
\fi
```

2.5 Separate box register

So far we have said nothing about the box number of \mybox. The following case that outputs the same page twice shows that we are not free in the use of the box register:

```
\shipout\copy<num> \shipout\box<num>
```

We manipulate the box by the hook and without ε -TEX the box must even be voided. However, the use case above requires that the box contents does not change at all. Therefore we must reserve a separate box register to avoid collisions with user box registers.

Note: Box register number 255 is special for the output routine, because TeX complains if this box is not voided by the output routine. However, this requirement does not apply to \shipout at all. In fact \shipout does not change any box register. This is usually done by a call of \box, but the output routine can do it later after invoking of \shipout.

2.6 Summary

2.6.1 With ε -T_EX

Putting the pieces together we get for ε -T_EX:

```
\newbox\mybox
\let\original@shipout\shipout
\shipout :=
 \edef\saved@grouplevel{\number\currentgrouplevel}
 \afterassignment\@test
 \setbox\mybox=
\@test :=
 \ifnum\saved@grouplevel<\currentgrouplevel
  \expandafter\aftergroup
 \fi
 \@output
\@output :=
 \ifvoid\mybox
  % cancel output of void box
 \else
  \@hook
  \ifvoid\mybox
```

```
% user code in \@hook could have voided the box
\else
\original@shipout\box\mybox
\fi
\fi
```

2.6.2 Without ε -T_EX, traditional way

```
And for T<sub>E</sub>X without \varepsilon-T<sub>E</sub>X:
```

```
\newbox\mybox
\begingroup
  \setbox\mybox=\box\mybox % ensure \mybox is void
\let\original@shipout\shipout
\shipout :=
 % trick to get a void box \mybox
 \begingroup
   \verb|\color| box \end{mybox} = \color| box \end{mybox}
 \endgroup
 \afterassignment\@test
 \setbox\mybox=
\@test :=
 \ifvoid\mybox
  \expandafter\aftergroup
 \fi
 \@output
\@output :=
 \ifvoid\mybox
  \% cancel output of void box
 \else
   \@hook
   \ifvoid\mybox
    % user code in \chook could have voided the box
    \original@shipout\box\mybox
   \fi
 \fi
```

2.6.3 \lastkern method

\newbox\mybox

And for TEX without $\varepsilon\text{-TEX}$ using the \lastkern method:

```
\let\original@shipout\shipout
\shipout :=
  \begingroup
  \setbox\mybox=\hbox\bgroup
  \kern1pt
  \afterassignment\@test
  \setbox\mybox=

\@test :=
  \ifdim\lastkern=0pt
  \expandafter\aftergroup
  \fi
  \@output

\@output :=
```

```
\egroup
\endgroup
\ifvoid\mybox
% cancel output of void box
\else
\@hook
\ifvoid\mybox
% user code in \@hook could have voided the box
\else
\original@shipout\box\mybox
\fi
\fi
```

3 Implementation

Package atbegshi uses ε -TeX's \currentgrouplevel, if it is available. Otherwise the \lastkern method is used.

```
56 (*package)
```

3.1 Reload check and package identification

Reload check, especially if the package is not used with LATEX.

5 Installation

5.1 Download

Package. This package is available on CTAN¹:

CTAN:macros/latex/contrib/oberdiek/atbegshi.dtx The source file.

CTAN:macros/latex/contrib/oberdiek/atbegshi.pdf Documentation.

Bundle. All the packages of the bundle 'oberdiek' are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

CTAN:install/macros/latex/contrib/oberdiek.tds.zip

TDS refers to the standard "A Directory Structure for TEX Files" (CTAN:tds/tds.pdf). Directories with texmf in their name are usually organized this way.

5.2 Bundle installation

Unpacking. Unpack the oberdiek.tds.zip in the TDS tree (also known as texmf tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory TDS:scripts/oberdiek/ for scripts that need further installation steps. Package attachfile2 comes with the Perl script pdfatfi.pl that should be installed in such a way that it can be called as pdfatfi. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

5.3 Package installation

Unpacking. The .dtx file is a self-extracting docstrip archive. The files are extracted by running the .dtx through plain TEX:

```
tex atbegshi.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as texmf tree):

```
atbegshi.sty & \rightarrow tex/generic/oberdiek/atbegshi.sty \\ atbegshi.pdf & \rightarrow doc/latex/oberdiek/atbegshi.pdf \\ atbegshi-example1.tex & \rightarrow doc/latex/oberdiek/atbegshi-example1.tex \\ atbegshi-example2.tex & \rightarrow doc/latex/oberdiek/atbegshi-example2.tex \\ test/atbegshi-test1.tex & \rightarrow doc/latex/oberdiek/test/atbegshi-test1.tex \\ test/atbegshi-test2.tex & \rightarrow doc/latex/oberdiek/test/atbegshi-test2.tex \\ test/atbegshi-test3.tex & \rightarrow doc/latex/oberdiek/test/atbegshi-test3.tex \\ atbegshi.dtx & \rightarrow source/latex/oberdiek/atbegshi.dtx
```

If you have a docstrip.cfg that configures and enables docstrip's TDS installing feature, then some files can already be in the right place, see the documentation of docstrip.

5.4 Refresh file name databases

If your TEX distribution (teTEX, mikTEX, ...) relies on file name databases, you must refresh these. For example, teTEX users run texhash or mktexlsr.

¹http://ctan.org/pkg/atbegshi

5.5 Some details for the interested

Unpacking with IATEX. The .dtx chooses its action depending on the format:

plain TEX: Run docstrip and extract the files.

LATEX: Generate the documentation.

If you insist on using \LaTeX for docstrip (really, docstrip does not need \LaTeX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{atbegshi.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file ltxdoc.cfg. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfIATEX:

```
pdflatex atbegshi.dtx
makeindex -s gind.ist atbegshi.idx
pdflatex atbegshi.dtx
makeindex -s gind.ist atbegshi.idx
pdflatex atbegshi.dtx
```

6 Catalogue

The following XML file can be used as source for the TEX Catalogue. The elements caption and description are imported from the original XML file from the Catalogue. The name of the XML file in the Catalogue is atbegshi.xml.

```
1121 (*catalogue)
1122 <?xml version='1.0' encoding='us-ascii'?>

7 History

[2007/04/17 v1.0]

• First version.

[2007/04/18 v1.1]

- New method based on \lastkern is used if ε -TEX is missing.
- \AtBeginShipoutDiscard also resets \deadcycles.

[2007/04/19 v1.2]

- \bullet \AtBeginShipoutEarly removed for simplification reasons.
- Forgotten definition of $\Delta tBegShi@Info$ added.
- Patches for packages crop and everyshi and class memoir added.

[2007/04/26 v1.3]

- Use of package infwarerr.
- Catcode section after generic header.

[2007/04/27 v1.4]

• Small optimizations.

[2007/06/06 v1.5]

- \AtBeginShipoutUpperLeft added.
- Example added.
- Fix in second test file for newer version of memoir.

[2007/09/09 v1.6]

• Catcode section rewritten.

[2008/07/18 v1.7]

• Documentation of \AtBeginShipoutUpperLeft fixed and extended.

[2008/07/19 v1.8]

 $\bullet \ \ \, \verb|\AtBeginShipoutUpperLeftForeground| added.$

[2008/07/31 v1.9]

- Second example (TrimBox for dvipdfmx) added.
- No changes in package code.

[2009/12/02 v1.10]

- $\bullet \ \, \backslash At Begin Ship out Original Ship out \ \, added.$
- Test file fixed.

[2010/03/01 v1.11]

• Compatibility with ini- T_EX except for \newbox .

[2010/03/25 v1.12]

• \AtBeginShipoutNext can now be used inside \AtBeginShipoutNext.

[2010/08/18 v1.13]

• Fixes for \AtBegShi@CheckDefinable.

[2010/12/02 v1.14]

 $\bullet\,$ Remove the warning because of void box if the hook calls .

[2011/01/30 v1.15]

• Already loaded package files are not input in plain TFX.

[2011/10/05 v1.16]

- \AtBeginShipoutAddToBox, \AtBeginShipoutAddToBoxForeground added.
- \AtBeginShipoutBoxWidth, \AtBeginShipoutBoxHeight, \AtBeginShipoutBoxDepth added.
- Updates for patches of class memoir.

[2016/05/16 v1.17]

• Documentation updates.

[2016/06/09 v1.18]

• Update for \pdfhorign in new LuaTeX.

8 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; plain numbers refer to the code lines where the entry is used.
